Starting with the basics, Telerik WPF Controls Tutorial will take you from the simple usage of a DataTable to serializing XML files into objects, covering a discussion of different types of security and validation for WPF windows along the way. This book will start out by showing you the simple methods of populating Telerik RadControls using a DataTable. You will then move on to look at populating a generic list of objects from a database as well as serializing XML files into class objects. You will cover how to secure a WPF application using a simple database example as well as Active Directory to determine navigation control loading. You will then review using the Telerik API interface classes to load Gantt information.
